

NO BALLS, AND PROUD OF IT!

NO MORE/LESS SPRAYING AND MARKING

Intact males, driven by testosterone, tend to lift their leg everywhere to mark their territory. Male cats tend to spray urine to mark their territory. Dogs who are obsessed with marking territory will tow you toward every tree and telephone pole. Some dogs will even mark inside your house. It is not the end all, cure-all for marking and/or spraying, but it certainly reduces the urge.

NO MORE RISK OF TESTICULAR CANCER, AND PROSTATE PROBLEMS

Neutering reduces the risk of enlarged prostate, prostate cysts, and prostate infections. Enlarged prostate occurs in more than 80% of intact male dogs past the age of five. About 7% of intact males develop a testicular tumor. Fortunately it seldom spreads and has a cure rate over 90%. But neutering prevents it entirely.

NO MORE UNWANTED BEHAVIOR

Neutering reduces some problem behaviors related to mating, such as roaming, marking, and aggression. When intact males cannot mate, they often get agitated, which can turn into aggressive behavior.

NO MORE UNWANTED PUPPIES

How would you feel if your dog got loose and bred with someone else's female? Now more puppies will be added to a world in which there are not enough homes. Any puppies created by your male dog will take homes away from dogs who are already here. It takes a lot of time, work, and money to produce a healthy litter, to nurture and socialize puppies and find good homes for them. What if your male dog passed along genes for a health problem? Imagine a puppy who must live with a painful or debilitating health problem because your male dog was allowed to breed.

A LONGER AND HAPPIER LIFE

Scientists from the University of Georgia determined the average age at death for intact dogs was 7.9 years versus 9.4 years for sterilized dogs.

ALL OF THE ABOVE

Be part of the solution. Neuter your pet, and prevent pet overpopulation. Make your dog healthier, friendlier, and work towards curbing those bad behaviors. Spay or Neuter your animals.
